#### Exposure to Oral Bisphosphonates and Risk of Esophageal Cancer

Chris R. Cardwell, PhD
Christian C. Abnet, PhD
Marie M. Cantwell, PhD
Liam J. Murray, MD

**Context** Use of oral bisphosphonates has increased dra and elsewhere. Esophagitis is a known adverse effect of cent reports suggest a link between bisphosphonate us this has not been robustly investigated.

Objective To investigate the association between bis

August2010: "Among patients in the UK General Practice Research Database, the use of oral bisphosphonates was not significantly associated with incident esophageal or gastric cancer"

cause serious esophagitis in some users.4,5 Crystalline material that resembles ground alendronate tablets has been found on biopsy in patients with bisphosphonate-related esophagitis, and follow-up endoscopies have shown that abnormalities remain after the esophagitis heals.6 Reflux esophagitis is an established risk factor for esophageal cancer through the Barrett pathway.7-9 It is not known whether bisphosphonaterelated esophagitis can also increase esophageal cancer risk. However, the US Food and Drug Administration recently reported 23 cases of esophageal cancer (between 1995 and 2008) in patients using the bisphosphonate alenthere were 41826 members in each cohort (81% w 11.4) years). One hundred sixteen esophageal or gas occurred in the bisphosphonate cohort and 115 (72 cohort. The incidence of esophageal and gastric cancer person-years of risk in both the bisphosphonate and and 0.44 per 1000 person-years of risk, respectively. T of esophageal and gastric cancer combined between phonate use (adjusted hazard ratio, 0.96 [95% confid risk of esophageal cancer only (adjusted hazard ratio, val, 0.77-1.49]). There also was no difference in risk of by duration of bisphosphonate intake.

**Conclusion** Among patients in the UK General Practic of oral bisphosphonates was not significantly associated gastric cancer.

egulatory Agency, pidemiology Research Objective To examine the hypothesis that risk of oesophageal, but not of gastric or colorectal, cancer is increased in users of oral bisphosphonates. Design Nested case-control analysis within a primary care cohort of about 6 million people in the UK, with prospectively recorded information on prescribing of bisphosphonates.

Setting UK General Practice Research Database cohort. Participants Men and women aged 40 years or over— 2954 with oesophageal cancer, 2018 with gastric cancer, and 10 641 with colorectal cancer, diagnosed in 1995-

Conclusions The risk of oesophageal cancer increased with 10 or more prescriptions for oral bisphosphonates and with prescriptions over about a five year period. In Europe and North America, the incidence of oesophageal cancer at age 60-79 is typically 1 per 1000 population over five years, and this is estimated to increase to about 2 per 1000 with five years' use of oral bisphosphonates.

#### INTRODUCTION

Adverse gastrointestinal effects are common among people who take oral bisphosphonates for the prevention and treatment of osteoporosis; they range from

Sept2010: "In this large nested casecontrol study within a UK cohort [General Practice Research Database], we found a significantly increased risk of oesophageal cancer in people with previous prescriptions for oral bisphosphonates"

Context Fluoroquinolon numerous case reports of ocular safety, particularly Objective To examine the risk of developing a retina Design, Setting, and Pa in British Columbia Cana Research

#### **Original Investigation**

## Association Between Oral Fluoroquinolone Use and Retinal Detachment

Björn Pasternak, MD, PhD; Henrik Svanström, MSc; Mads Melbye, MD, DrMedSci; Anders Hviid, MSc, DrMedSci

**IMPORTANCE** A recent study of ophthalmologic patients found a strong association between fluoroquinolone use and retinal detachment. Given the prevalent use of fluoroquinolones, this could, if confirmed in the general population, translate to many excess cases of retinal detachment that are potentially preventable.

al fluoroquinolone use is associated with an increased risk of

April2012: "Patients taking oral fluoroquinolones were at a higher risk of developing a retinal detachment"

ally sociated with a wide array of adverse events such as dysglycemia,1 cardiac arrhythmia,<sup>2</sup> and neuropsychiatric events.3 Fluoroquinolones also have been linked to several forms of ocular toxicity such as corneal perforations,4 optic neuropathy,5 and retinal hemorrhages.6 In 2011, the label for gemifloxacin was updated to include hemorrhage,6 which includes retinal hemorrhage that was reported during postmarketing surveillance. A classwide warning for fluoroquinolones also has been issued for tendon rupture,7 which raises concerns for the effect of these drugs on connective tissue in the eve. Animal studies also provide evidence for retinal degeneration with use

a higher risk of developing adjusted rate ratio [ARR], 4 vs 0.2% of controls; ARR, 6.1% of controls; ARR, 1. tachment. The absolute in person-years (number nee lones). There was no evide tachment and  $\beta$ -lactam ar  $\beta$ -agonists (ARR, 0.95 [95

Dec2013: "Oral fluoroquinolone use was not associated with increased risk of retinal detachment"

**RESULTS** A total of 566 cases of retinal detachment occurred, of which 465 (82%) were rhegmatogenous detachments; 72 in fluoroquinolone users and 494 in control nonusers. The crude incidence rate was 25.3 cases per 100 000 person-years in current users, 18.9 in recent users, 26.8 in past users, and 24.8 in distant users compared with 19.0 in nonusers. Compared with nonuse, fluoroquinolone use was not associated with a significantly increased risk of retinal detachment: the adjusted RRs were 1.29 (95% CI, 0.53 to 3.13) for current use;

## Introducing OHDSI

- The Observational Health Data Sciences and Informatics (OHDSI) program is a multistakeholder, interdisciplinary collaborative to create open-source solutions that bring out the value of observational health data through large-scale analytics
- OHDSI has established an international network of researchers and observational health databases with a central coordinating center housed at Columbia University

# Why large-scale analysis is needed in healthcare

## What is large-scale?

## • Millions of observations

Need for performance in handling relational structure with millions of patients and billions of clinical observations, focus on optimization to analytical use cases.

## Millions of covariates

No analytics software in the world can fit a regression with >1m observations and >1m covariates on typical hardware... but CYCLOPS can!

### Millions of questions

Systematic solutions with massive parallelization should be designed to run efficiently for one-at-a-time AND all-by-all

# Questions OHDSI seeks to answer from observational data

- Clinical characterization:
  - Natural history: Who are the patients who have diabetes? Among those patients, who takes metformin?
  - Quality improvement: what proportion of patients with diabetes experience disease-related complications?
- Population-level estimation
  - Safety surveillance: Does metformin cause lactic acidosis?
  - Comparative effectiveness: Does metformin cause lactic acidosis more than glyburide?
- Patient-level prediction
  - Given everything you know about me and my medical history, if I start taking metformin, what is the chance that I am going to have lactic acidosis in the next year?

## **OHDSI Communities**

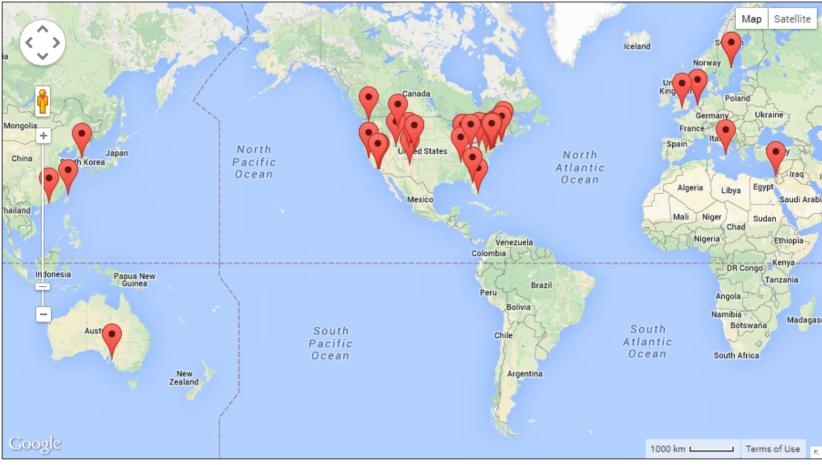

Community: a social unit of any size that shares common values

--http://en.wikipedia.org/wiki/Community

OHDSI's communities:

- Research
- Open-source software development
- Data network

## OHDSI's global research community

- >120 collaborators from 11 different countries
- Experts in informatics, statistics, epidemiology, clinical sciences
- Active participation from academia, government, industry, providers

http://ohdsi.org/who-we-are/collaborators/

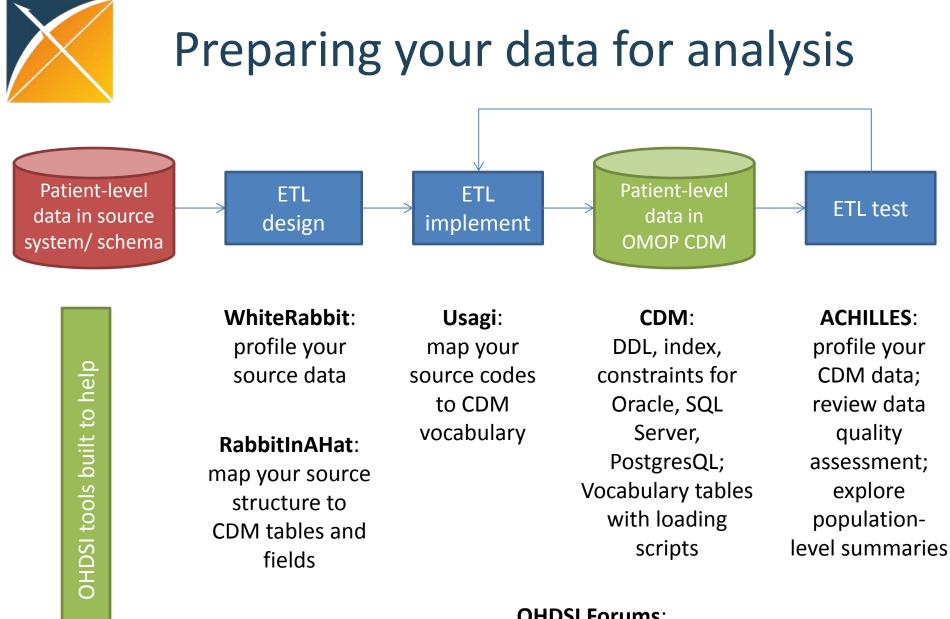

Data network accomplishments, 2014

- Databases in OMOP CDM
  - 58 databases reported in progress or completed
  - Types: Administrative claims, electronic health records, health information exchanges, hospital billing data, clinical registries, national surveys
  - 9 countries: US, UK, Italy, Germany, Netherlands, Korea, Taiwan, Hong Kong, Japan
  - >682 million patients covered across sources

## The odyssey to evidence generation

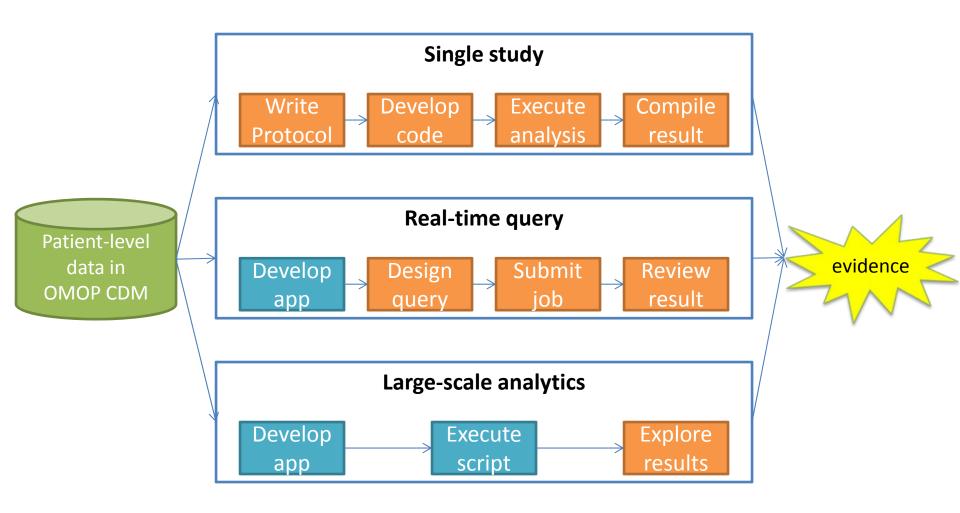

**OHDSI Forums:** 

Public discussions for OMOP CDM Implementers/developers

http://github.com/OHDSI

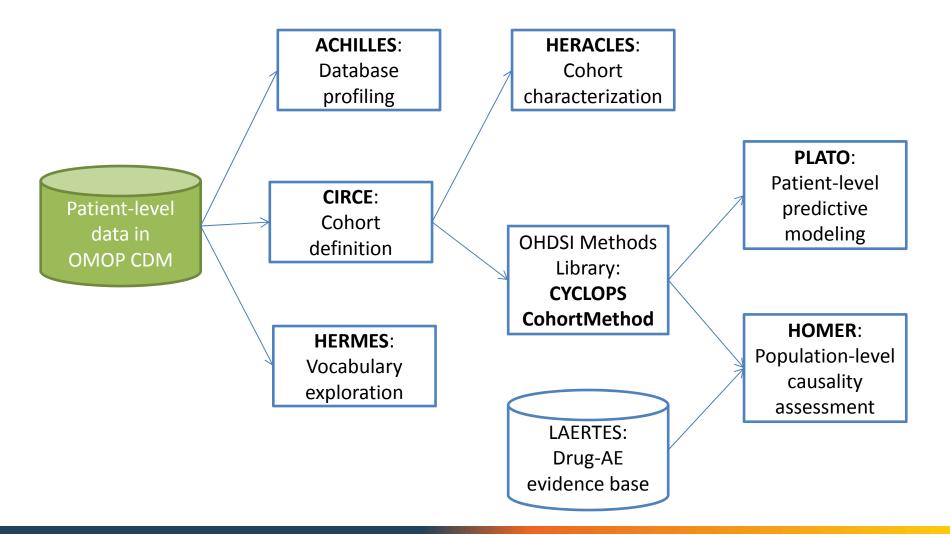

## **Data-Evidence** sharing paradigms

## Standardized large-scale analytics tools under development within OHDSI

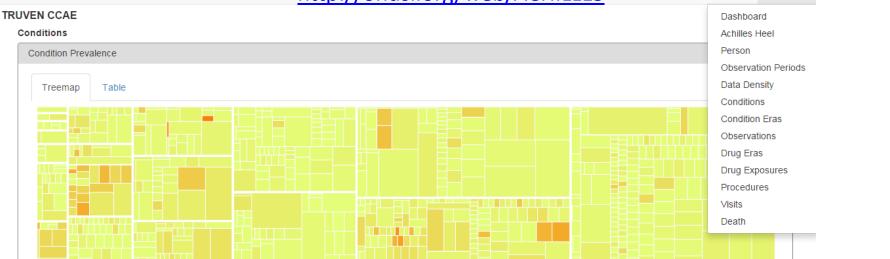

http://github.com/OHDSI

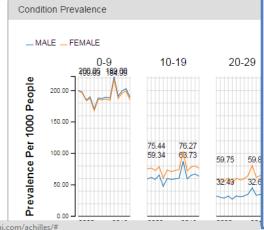

## Large-scale analytics example: **ACHILLES**

#### http://ohdsi.org/web/ACHILLES

Box Size: Prevalence, Color: Records per Person (Blue to Orange = Low to H

#### Acute upper respiratory infection

>12 databases from 5 countries across 3 different platforms:

Data Sources -

Reports -

Single study example: Treatment pathways

Open-source process:

- Write protocol: <u>http://www.ohdsi.org/web/</u> <u>wiki/doku.php?id=research:</u> <u>studies</u>
- Program analysis: <u>https://github.com/ohdsi</u>
- Execute code on CDM and centrally share results
- Collaboratively explore statistics and jointly publish findings

Treatment pathway example:

- Conceived at AMIA 15Nov2014
- Protocol written, code written and tested at 2 sites 30Nov2014
- Analysis submitted to OHDSI network 2Dec2014
- Results submitted for 7 databases by 5Dec2014, other databases awaiting IRB approval
- Preview of findings now...

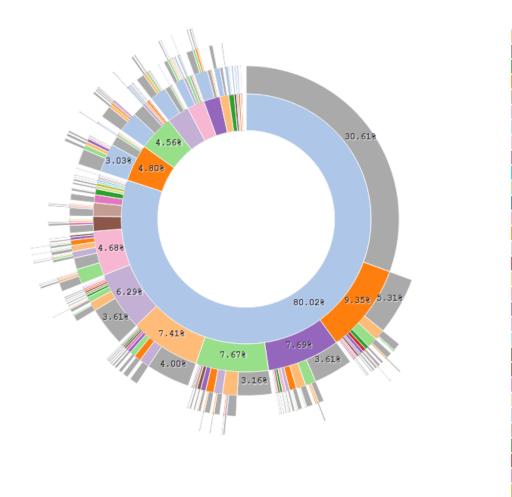

http://www.ohdsi.org/web/wiki/doku.php?id=research:treatment\_pathways\_in\_chronic\_disease

## Treatment pathway results

Disease: T2DM; Year: All; Source: CCAE

۳

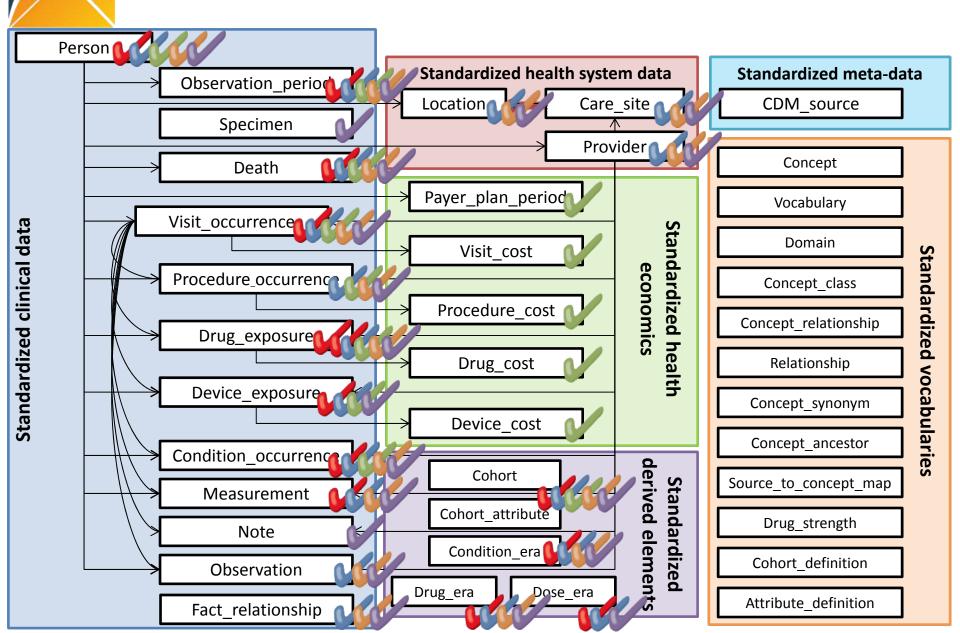

## **Concluding thoughts**

- An international community and global data network can be used to generate real-world evidence in a secure, reliable and efficient manner
- Multiple evidence sharing paradigms can and should be used, but all require systematic approaches enabled by a common data model
- Statisticians can and should play a leading role throughout the journey from data to evidence

## One model, multiple use cases

## Revisiting clopidogrel & GI bleed (Opatrny, 2008)

Agent	Cases (n = 4028)	Controls (n = 40 171)	Crude rate ratio	Adjusted rate ratio*	95% confidence interval
Antidepressant	s				
SSRI	335 (8.3%)	1780 (4.4%)	1.97	1.33	1.09, 1.62
TCA	262 (6.5%)	1764 (4.4%)	1.52	1.04	0.83, 1.30
Venlafaxine	56 (1.4%)	229 (0.6%)	2.48	1.85	1.34, 2.55
Anticoagulant					
Warfarin	281 (7.0%)	1130 (2.8%)	2.64	2 17	1.82, 2.59
Clopidogrel	160 (4.0%)	532 (1.3%)	3.16	2.07	1.66, 2.58

OMOP, 2012 (CC: 2000314, CCAE, GI Bleed)

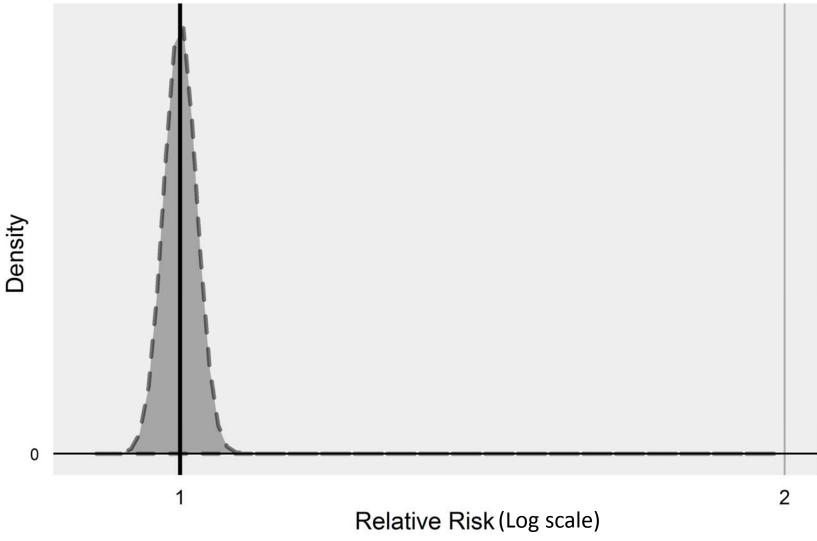

Relative risk: 1.86, 95% CI: 1.79 – 1.93

Standard error: 0.02, p-value: <.001

## Null distribution

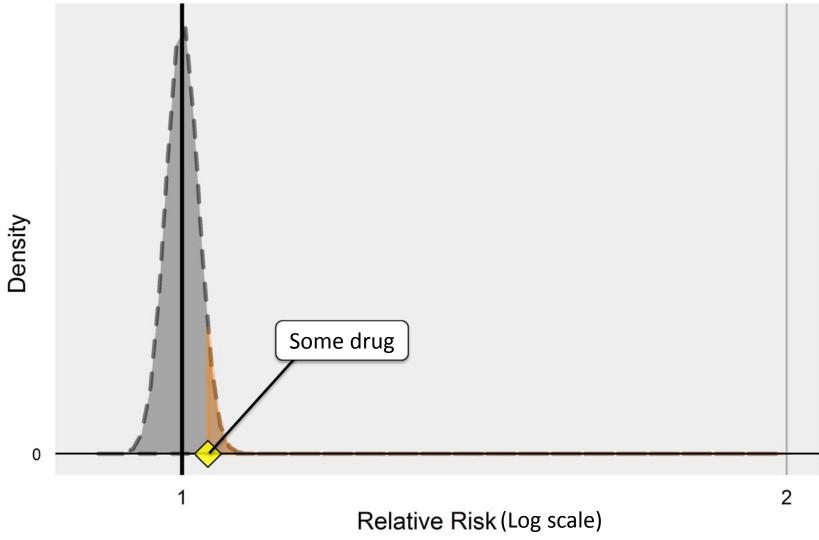

CC: 2000314, CCAE, GI Bleed

## Null distribution

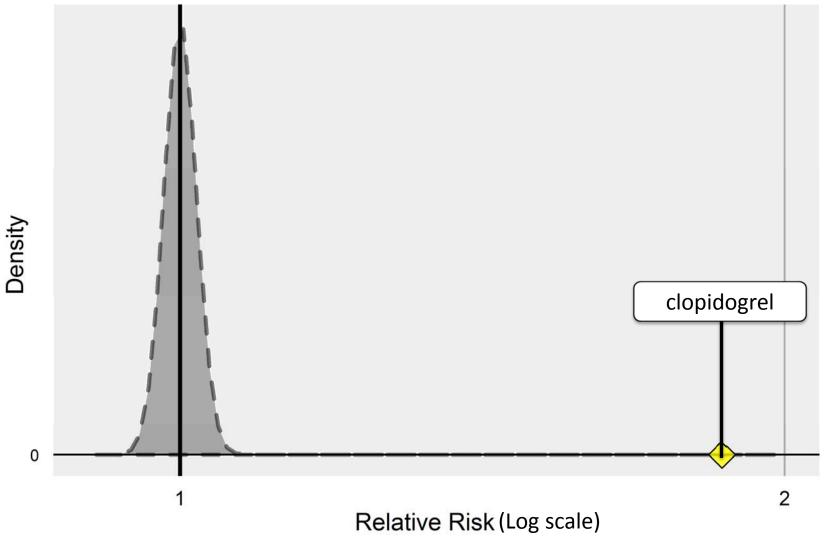

CC: 2000314, CCAE, GI Bleed

## Null distribution

CC: 2000314, CCAE, GI Bleed

## Evaluating the null distribution?

- Current p-value calculation assumes that you have an unbiased estimator (which means confounding either doesn't exist or has been fully corrected for)
- Traditionally, we reject the null hypothesis at p<.05 and we assume this threshold will incorrectly reject the null hypothesis 5% of time. Does this hold true in observational studies?
- We can test this using our negative controls

## Ground truth for OMOP 2011/2012 experiments

	Positive	Negative	
	controls	controls	Total
Acute Liver Injury	81	37	118
Acute Myocardial Infarction	35	66	102
Acute Renal Failure	24	64	88
Upper Gastrointestinal Bleeding	24	67	91
Total	165	234	399

Criteria for negative controls:

- Event not listed anywhere in any section of active FDA structured product label
- Drug not listed as 'causative agent' in Tisdale et al, 2010: "Drug-Induced Diseases"
- Literature review identified no evidence of potential positive association

### Negative controls & the null <u>distribution</u> cc: 2000314, CCAE, GTBleed
